Goodness of Fit Worksheet

Discrete Random Variables

Police Calls- The Eastland Police Department released the following numbers for calls for different days in a week.

1. Use the 1% level of significance to test the claim that the different number of calls have the same frequency.

х	0				
Monday	144				
Tuesday	149				
Wednesday	162				
Thursday	185 370 388				
Friday					
Saturday					
Sunday	402				
Total	1800				

2. Use the 5% level of frequency to test the claim that the expected proportion described below.

х	0	p(x)
Monday	144	0.1
Tuesday	149	0.1
Wednesday	162	0.1
Thursday	185	0.1
Friday	370	0.2
Saturday	388	0.2
Sunday	402	0.2
Total	1800	

3. **Baseball Player Births**- American born Major League Baseball players have the following frequency counts for the different months of the year. Use the **5% level of significance** to tests the claim that MLB players are born with the same frequency for the different months. **Assume** $p(x) = \frac{1}{12}$ for all x

Months	0
January	387
February	329
March	366
April	344
May	336
June	313
July	313
August	503
September	421
October	434
November	398
December	371
Total	4515

4. Flat Tire and Missed Test- Four carpooling students missed a test and claimed it was due to a flat tire. The instructor separated the students and asked what tire was flat (Left front, left rear, right front, right rear) to determine the consistency of their story and identify the same tire. An instructor ran a blind experiment and asked the class which tire they thought the carpool would select? The following data illustrates the results of the flat tire experiment. Use the 1% level of significance to test the claim that the students' responses were uniform (same probability) p(x) = 0.25 for all x.

Tire	0
Left Front	11
Left rear	15
Right Front	12
Right Rear	8
Total	46

5. **Student Arrivals-** We know that student arrivals for office hours have a Poisson Distribution with a mean μ . We can use the **Goodness of Fit Test** to verify that the distribution is in fact a Poisson Distribution. The following table represent the number of arrivals in a typical office hour for various random days. Use the **5% level of significance** to test the claim that the distribution fits the **expected proportion** below. **Note-** $\mu = 2.2$ student visitors per office hour.

х	0	p(x)		
0	7	0.111		
1	18	0.244		
2	22	0.268		
3	15	0.197		
4	10	0.108		
5	5	0.048		
6	2	0.017		
more than 6	1	0.007		
Total	80	1		

6. Lifespan of US Residents- The Lifespan of US Residents are presumed to be Normally Distributed. The following table represents the counts (frequency) of lifespans for US citizens in the last year. Use the 1% level of significance to test the claim that the distribution fits the expected proportions below. Note- $\mu = 78.6$; $\sigma = 9.5$

x	0	p(x)
Less than 45	3	0.0002
Between 45 and 54.99	3	0.0063
Between 55 and 64.99	25	0.0695
Between 65 and 74.99	85	0.2758
Between 75 and 84.99	120	0.3970
Between 85 and 94.99	65	0.2080
Between 95 and 104.99	16	0.0394
At least 105	3	0.0027
